Overview

This API allows taxpayer ERP system to retrieve the details of document type version that contains structure definitions of the documents that are expected to be submitted as part of document submission.

Document type versions are used to allow document type data fields to be evolved over time without introducing a new document type. For example, if the document type version 1.0 include optional field(s), such field(s) could at a later time be made mandatory in document type version 2.0

Note that it is possible for one document type to have multiple valid document type versions to ease transition. In other words, taxpayers would still be able to submit old versions for validation despite the new / updated version has been deployed. It is however suggested for the taxpayers to migrate to the latest document type version as soon as possible.

Signature

This is REST based API that takes unique ID of the document type and ID of the document type as URL parameter and returns full document type version object.

Signature: `GET /api/v1.0/documenttypes/{id}/versions/{vid}`

Inputs

This API accepts standard e-Invoice API header parameters for authenticated call.

URL PARAMETER	TYPE	DESCRIPTION	VALUE EXAMPLE
id	Number	Unique ID of existing document type	45

| URL PARAMETER	TYPE	DESCRIPTION	VALUE EXAMPLE
vid	Number	Unique ID of existing document type version that is published or deactivated	41235

Outputs

Successful Response

This API returns HTTP status code `200` .

The resulting structure is a single object of type `DocumentTypeVersion` .

Document Type Version contains:

OUTPUT PARAMETER	TYPE	DESCRIPTION	VALUE EXAMPLE
invoiceTypeCode	Number	The document type code from the possible values: `01` , `02` , `03` , `04` , `11` , `12` , `13` , `14`	04
name	String	Name of the document type version within the document type that can be used in document submission to identify document type version being submitted	1.0
description	String	Description of the document type version	Credit note version 1.0
versionNumber	Decimal	Unique version number of the document type version that can be sorted to find the latest version	1.0
status	String	Status of the document type version - "published", "deactivated"	published
activeFrom	Date	Date when the activity of the document type version started	2015-02-13T13:15:00Z
activeTo	Date	Optional: date when the activity of the document type version sends/when it was deactivated	2027-03-01T00:00:00Z
jsonSchema	String	Base64 encoded JSON schema definition defining the technical structure of the JSON representation of the document type in this version. System will support UBL 2.1 standard schemas.	Base64 encoded string
xmlSchema	String	Base64 encoded XML schema definition defining the technical structure of the XML representation of the document type in this version. System will support UBL 2.1 standard schemas.	Base64 encoded string

Error Response

Error situations are reported back by this API through the standard error response.

No custom error codes are provided by this API.

Additional considerations

To get the ID used to call this API, taxpayer system needs to first call API returning list of the document types and their versions.
